

עבודת כיתה

- נממש תכנית לחישוב משכורת של עובדים הבאים:

Employee —

Sales Employee —

Manager —

Sales Manager —

Salary calculation

- Sales Employee:

$$\text{Salary} = \text{Salary of Employee} * (1 + \text{commis}/100)$$

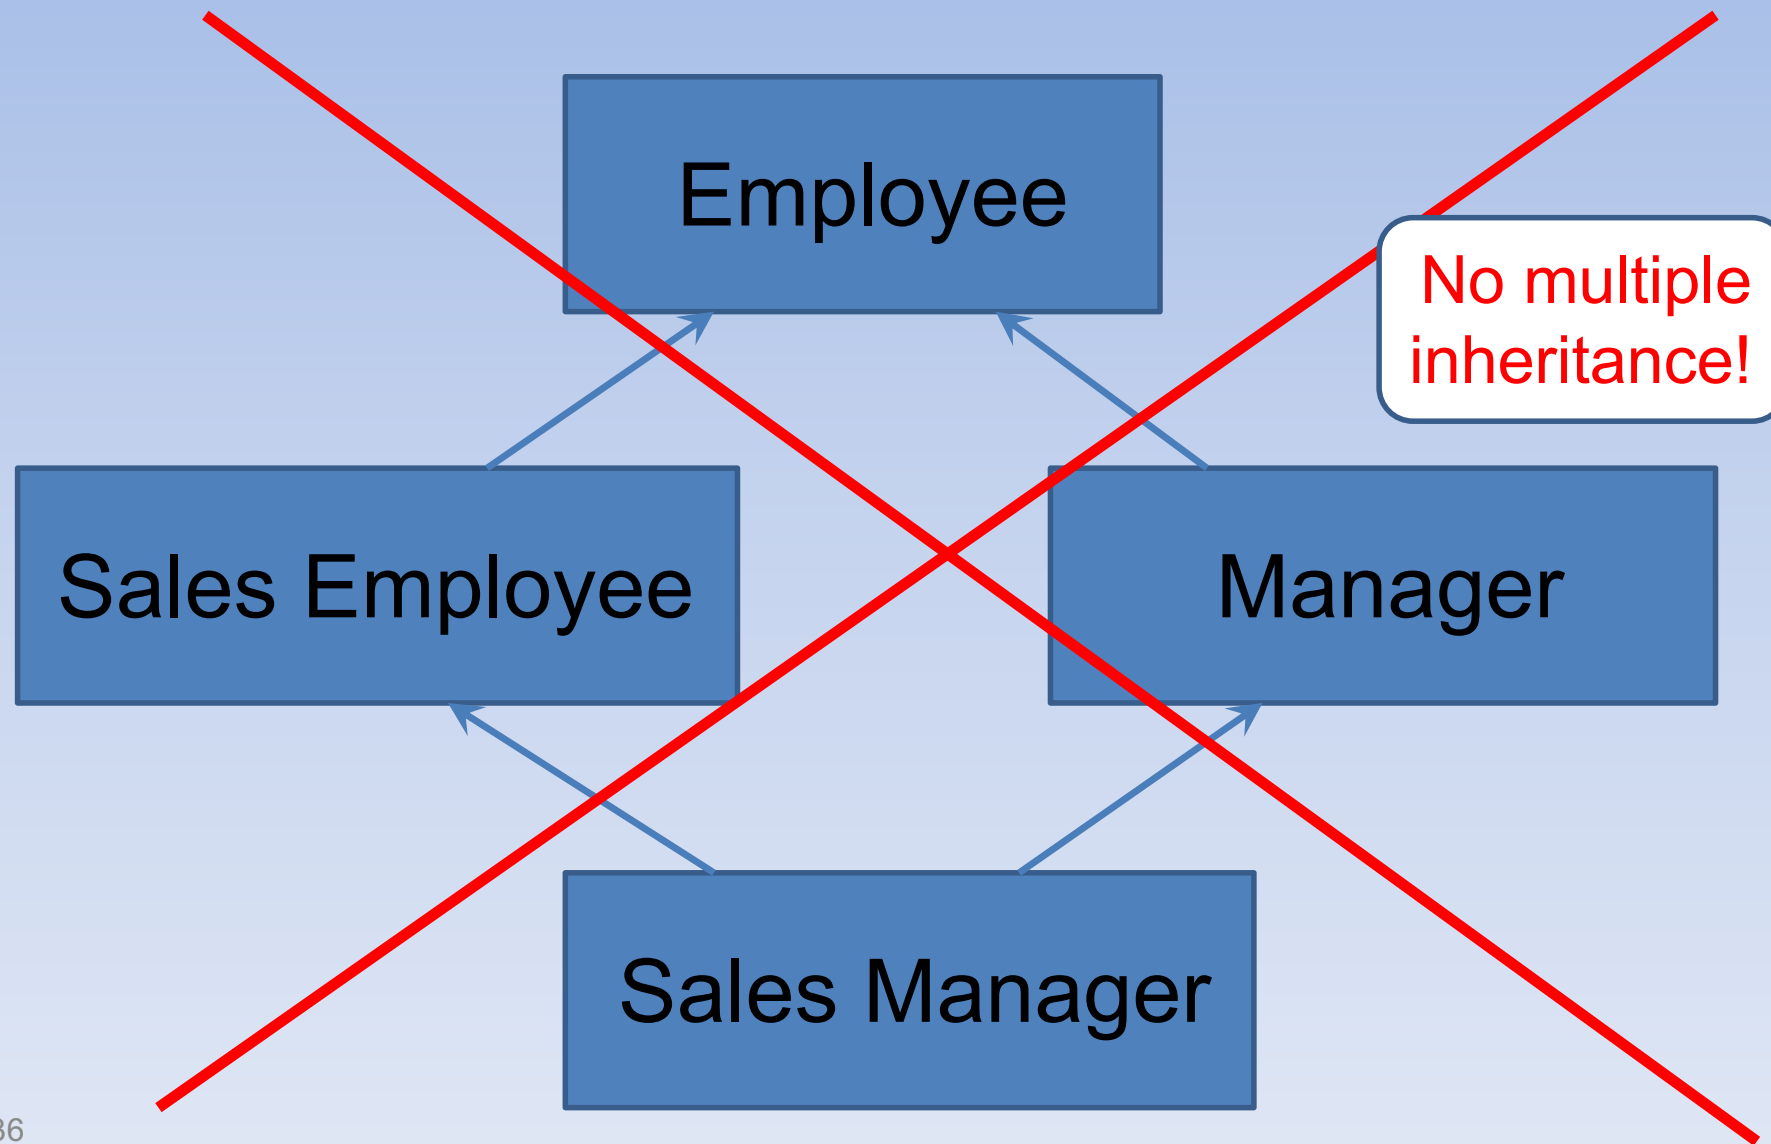

- Manager :

$$\text{Salary} = \text{Salary of Employee} * \text{kmult}$$

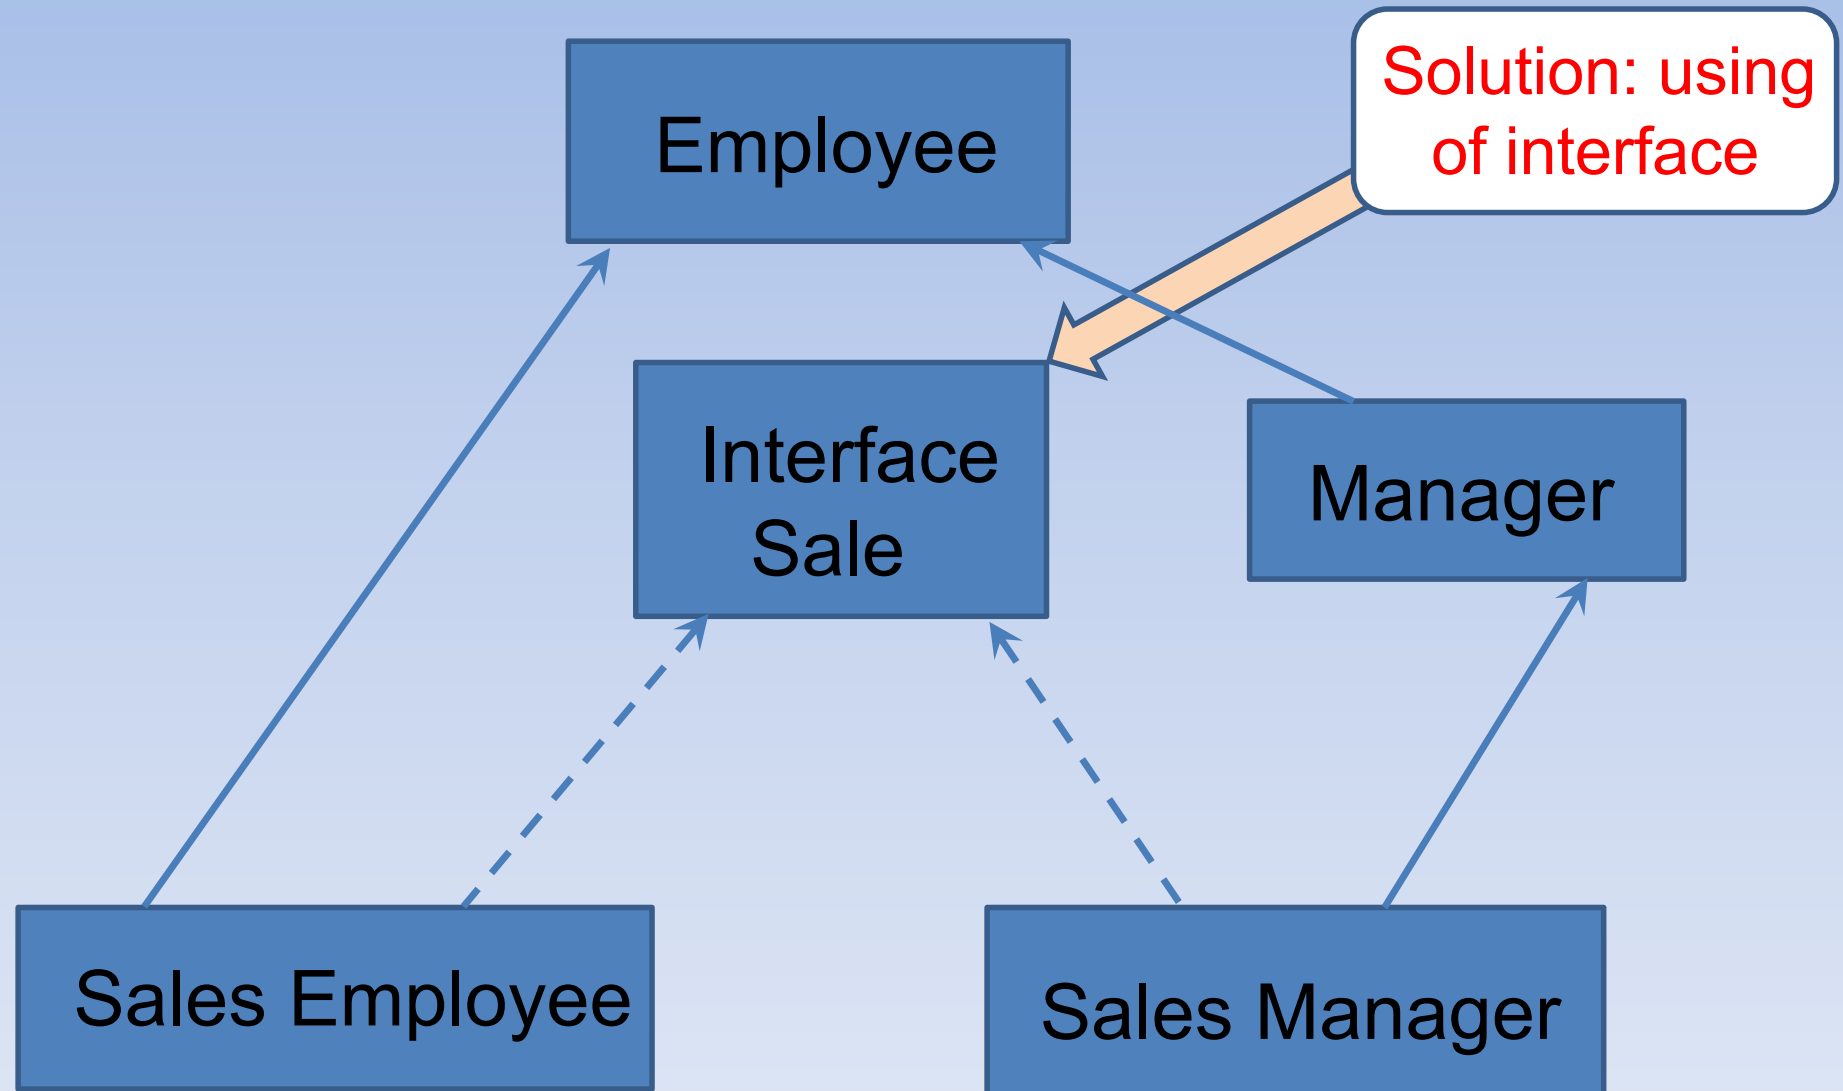

- Sales Manager :

$$\text{Salary} = \text{Salary of Employee} * \text{kmult} * (1 + \text{commis}/100)$$

Interface Sale

פונקציות
ללא גוף

```
public interface Sale
{
    public float getCom();
    public String getSaleName();
}
```

`getCom()` - function for
access to commissions
of Sales Employee

`getSaleName()` - function for
access to name
of Sales Employee

Class Employee

```
public class Employee
{
    private float salary;

    public Employee(float salary)
    {
        // TODO
    }

    public float ComputeSalary()
    {
        // TODO
    }

    public String getName() { return "Employee"; }
}
```

Class Manager

```
public class Manager extends Employee
{
    private float kmult;

    public Manager(float salary, float kmult)
    {
        // TODO
    }

    public float ComputeSalary()
    {
        // TODO
    }

    public String getName() { return "Manager"; }
}
```

Class Sales Employee

```
public class SalesEmployee extends Employee implements Sale
{
    private float commis;

    public SalesEmployee(float salary, float commis)
    {
        // TODO
    }

    public float ComputeSalary()
    {
        // TODO
    }

    . . .
    // TODO
    . . .
}
```

Class Sales Manager

```
public class SalesManager extends Manager implements Sale
{
    private float commis;

    public SalesManager(float salary, float kmult, float commis)
    {
        // TODO
    }

    public float ComputeSalary()
    {
        // TODO
    }

    . . .
    // TODO
    . . .
}
```

Driver

```
public class Salary
{
    public static void main(String[] args)
    {
        // TODO:
        // To create four different types of employees
        // and to print their names and salaries
    }
}
```
